The typical cyclic groups are $\mathbb{Z}_n$

$\mathbb{Z}_n = \{0, 1, 2, \ldots, n-1\}$

If k is a generator, then $n-k$ is too. ($(k,n)=1 \Rightarrow n-k$ is a generator)

Fund. thm. of finite comm. groups

Every finite comm. gp is isomorphic to a sum of cyclic groups. $G \cong \mathbb{Z}_{n_1} \oplus \mathbb{Z}_{n_2} \oplus \cdots \oplus \mathbb{Z}_{n_k}$

for some $n_1, \ldots, n_k$ not nec. distinct
