

2G Bio-Energietechnik secures sales rights for innovative microCHP system

"WhisperGen™"

- + 36 million EUR contribution to turnover expected by 2011
- + Europe's only mass-produced CHP system in the 1 kWel power class
- + Potential energy cost savings of 30 to 50 %
- + Subsidised on the basis of the German CHP law (KWKG)

Heek, 14 August 2008 – 2G Bio-Energietechnik AG, one of the leading German providers of systems for decentralised energy supply, has secured comprehensive sales rights for the innovative microCHP system WhisperGen™ for the German market, via its subsidiary AEM GmbH. WhisperGen™ is currently the only mass-produced CHP system in Europe which has a capacity of 1 kWel. Thus, as of now, 2G offers an economically priced and environmentally friendly complete solution, particularly for home owners in Germany, which comprises not only the supply of heat and hot water, but also a considerable portion of the household electricity supply. Remuneration is paid for self-used and excess electricity. Management expects that this innovation, which 2G has already successfully tested in practice over several years, will already contribute significantly to growth in turnover and profit as of 2009.

It was as recently as the end of March 2008 when 2G Bio-Energietechnik AG became the majority shareholder in AEM GmbH, so that via this new subsidiary, it could bundle its activities for private customers with a focus on decentralised energy generation for the production of electricity and heat and provision of corresponding services. The sales rights for WhisperGen™ allow this business division to be developed considerably more quickly than originally planned.

"We estimate a turnover contribution of around 3.5 million EUR already in the coming business year, and in the next three years we want to bring in around 36 million EUR with the WhisperGen™," states Christian Grotholt, chairman of the management board. It is his view that there is a very high market potential for micro power plants such as this, with an electrical power rating of 1 kW. He says that as a total of around 650,000 new heating systems which correspond to the power class of the WhisperGen™ are installed in Germany each year, he sees significant market opportunities for heating systems with integrated electricity generation, especially considering the rising energy costs.

The WhisperGen™ microCHP system is a highly energy-efficient unit, with combined heat and power generation which achieves an excellent level of efficiency. In terms of space requirements and noise emissions, it is similar to a standard dishwasher. WhisperGen™ not only supplies the household with electricity and heat, but also feeds excess electricity into the public grid automatically. According to the recently passed amendment to the German CHP law (KWKG), the electricity generated in this way will in future qualify for multiple subsidisation: alongside the existing feed-in tariff for self-generated electricity, as of 2009 a bonus will also be granted for consumption of self-generated electricity. In addition, the mineral oil tax included in the gas price will be completely refunded. Thus, the household's energy costs can be sustainably reduced by 30 to 50 %. Furthermore, each unit can save up to a ton of CO₂ each year, which constitutes a significant contribution to climate protection which every household can make.

Company profile

2G Bio-Energetechnik AG is one of the leading German providers of decentralized energy supply systems. Along with the development, construction, installation and operation of co-generation plants, the company offers complete solutions in a growing market for highly efficient co-generation plants, which will greatly benefit from the political will in climate protection in the coming years. 2G Bio-Energetechnik AG also focuses on the growth market of gas processing and the energetic exploitation of digestates, since more and more gas processed from biomasses is to be supplied = in the public gas network.
