

Bringing It All Together: How Geometry Becomes Physics

- Heim's polymetric equations (54, 54a) encode a new paradigm:
 - **Geometry:** A multi-metric, modal manifold (6D/12D)
 - **Curvature:** Not just gravity, but the full structure of physical possibility.
 - **Selector logic:** Operator fields (selectors) act to "filter" and actualize only specific, permitted configurations as fields or particles.
- **Physical reality emerges as a spectrum of eigenstates**—selected by modal logic, structured by polymetric geometry.
- **Measurement, quantization, and law** are no longer added on, they are intrinsic to the very logic of geometry.

Synthesis:

Heim's theory fuses geometry, logic, and selection into a single computable framework where "what exists" is an outcome of structure and rule, not assumption.
