

Additional Topics for Future Discussion?

Not Propulsion Related but of General UAP Interest.

A small portion of the content in this presentation has been posted on the Figshare website for approximately two years. It has received significant attention, as evidenced by the number of views and downloads recorded in usage data. Recently, I began to suspect that a few of the ideas presented had taken on a life of their own in public testimony and the broader UAP community. This is not unusual in the community and should be expected. (I will address some of these during the presentation if time permits.)

They are:

- Projected realities vs. simulation or dream states
- The nature of objective reality.
- Transit within and between objective realities.
- Alternate realities and "Many Worlds."
- The geometry of multiple realities.
- The role of consciousness in multiple objective realities.
- The projection of consciousness. Human vs. AGI.
- The biomorphic basis of AGI and why algorithms are not conscious
- Why the Turing Test is not suitable for evaluating AGI.
- The basis for a new assessment of AGI consciousness.
- When will machine inference become reality, and how will we know?
- The role of observation and determinism and the role of entanglement in multiple objective realities
- The true nature of time and the philosophical and theological basis supporting UAP assessment and interaction.
- The importance of physical experimentation

I will be glad to discuss any of these topics in open discussion and will defer to the host's judgment on how best to cover the material, if at all, whether now or in the future. (Some topics are best suited for a stand-alone presentation.)
