

Bias

The good, the bad, and the ugly.

Ideas Subsequently Generated from the Khafre Analysis

- Discrete compressed time field generation and subsequent transmission and receipt of quantum information.
- Tunable discrete compressed time projection and its role in potential transit.
- Negative energy generation.
- Gravitational effects of multi-ferroic infinitely compressible aperiodic crystalline structures during phase transition.
- The geometric structure of multiple realities in time.

It's okay to think outside the box. You never know where it may lead and what you may learn. Just be sure to take bias into account.
