

Ontology in Heim Theory — Structured Reality from Modal Logic

Heim's Ontological Commitments

- Reality is **modal**, stratified, and quantized — defined by logical constraints, not spatial extension.
- Metrons $\tau = \frac{\hbar G}{c^3}$ define 2D quantized surfaces. Space is built from surface elements, not from points or substances.
- Fields do not exist "on their own" — they are generated by selector logic under modal permission conditions.
- Ontology is layered and structurally sequenced:

Zone $\Rightarrow$ Selector $\Rightarrow$ Observer Projection

- There is no absolute "stuff" — only quantized activations structured by eigenvalue logic.

Consequences

- Matter arises as the eigenvalue realization of a geometric selector configuration.
- Causality is not force-transmission, but *modal accessibility* — whether a transition is allowed.
- Space is not a container, but a projection surface constructed from modal structure.
