

Fig. 3. Overview of the survey taxonomy for document parsing.

The taxonomy should also reflect the historical evolution of the field. Document analysis has progressed from rule-based and heuristic systems to statistical learning pipelines, and more recently to unified multimodal architectures. Capturing these transitions helps contextualize current approaches and clarifies how modeling assumptions have shifted over time.

Finally, the classification should align with common evaluation practices, datasets, and supervision strategies. Methods that share similar training objectives, supervision signals, and evaluation protocols often exhibit consistent design patterns and can be naturally grouped together.

Guided by these principles, the taxonomy presented in this survey primarily organizes document parsing methods according to their architectural structure.
