

EX.

$\boxed{\phantom{0}} + \boxed{\phantom{0}} + \boxed{\phantom{0}} + \boxed{\phantom{0}} + \boxed{\phantom{0}} + \boxed{\phantom{0}}$

The sum depends only on the parity of of a-boxes. If there are an even number of a-boxes, then the result is 0, while if there are an odd number of a-boxes, then the result is  $0^a$ .

### Recursive def'n of Boxes

① zero ( $\boxed{\phantom{0}}$ ) and a-zero ( $\boxed{\phantom{0}}$ ) are both Boxes

② If  $X, Y, \dots, Z$  are Boxes, then so are
