

Clarifying the Framework

- Heim Theory is a **geometric-semantic framework** grounded in:
 - Tensor geometry and quantized surfaces,
 - Modal logic and selector fields,
 - Discrete operator structures and syntropic convergence.
- What it is not:
 - Not a religion, or dogma, or ideology.
 - Not a philosophy, or a metaphysical system.
 - Not a science, or a technology, or a method.
- All constructs are defined within a stratified, quantized geometry over $\mathbb{R}^6$, grounded in operator-theoretic rigor. While the extension to $\mathbb{R}^{12}$ remains incompletely formalized, this limitation is well-understood and explicitly treated as an open problem. Heim pursued a formal and ontologically committed reconstruction of physical reality.
- Heim's logic layer is semantic — but strictly in the formal, structured sense: no anthropocentrism, no idealism.
