

Conrad-Martius' Realontologie and the Layered Structure of Heim Theory (II)

Conrad-Martius: Ontological Stratification of Reality

- Reality is not flat — it consists of structured layers, each with its own laws of manifestation and modality of being:
 - **Stoffbasis** — material substrate: matter, extension, quantity.
 - **Wirkbasis** — efficacy and process: causality, force, dynamic relation.
 - **Sinnbasis** — meaning and teleology: directionality, order, intentionality.
- Each layer builds upon the former, but cannot be reduced to it.
- Science must uncover not just behavior but **ontological function**.

Heim's Modal Geometry and Selector Logic

- Heim implements these philosophical layers in physics:
 - The selector field $S_N(\tau)$ determines which layer becomes active — just as in Realontologie, only certain structures emerge at certain ontological levels.
 - Heim's approach answers the call Conrad-Martius posed: to give science an **ontological backbone**.
