

Kontrabarie: Experimental Opportunities

To test this concept:

- Look for EM field configurations that couple to modal selector analogs.
- Search for anomalous reductions in inertial response or gravitational interaction.
- Modulate field gradients and torsion symmetries dynamically.

What to measure:

- Weight anomalies in toroidal field shells,
- Variations in inertial mass under high-frequency modal tension,
- Time-variant collapse signatures from syntropic gradients.

This drive is geometric — propulsion emerges from modal cancellation, not force.
